

## KEELOQ® HCS30X, HCS200 Stand-Alone Programmer

Author: Maurizio Fiammeni  
Microchip Technology Inc.

### OVERVIEW

This application note describes how to implement a KEELOQ stand-alone programmer using a Microchip PIC16F84A microcontroller.

The PIC16F84A is a FLASH microcontroller with 64 bytes of internal EEPROM that, in this design, is used to store the incremental serial number programmed into HCS encoders every time. All the other HCS configuration parameters are defined as constants in the FLASH program memory of the PIC16F84A.

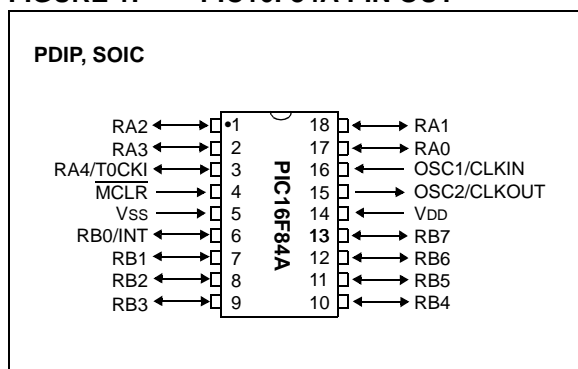

Two learning schemes are implemented:

- The simple learning scheme for which you can find the complete software in this application note.
- The normal learning scheme with the applicable software included in the KEELOQ license agreement disks (this software includes the KEELOQ decryption routine).

In the first scheme, the Encryption Key programmed in the HCS encoders is always the same and equal to the Manufacturer's Code.

In the second scheme, before starting to program the encoder, the PIC16F84A calculates the Encryption Key for that encoder using the 64-bit Manufacturer's Code and the 28-bit serial number running the KEELOQ decryption algorithm.

**FIGURE 1: PIC16F84A PIN OUT**

### KEELOQ SIMPLE LEARNING SCHEME

#### (Fixed Key)

This learning scheme implements the lowest level of security for a KEELOQ based security system. With this method, every programmed encoder has a different serial number, but the same fixed Encryption Key is equal to the chosen Manufacturer's Code.

**FIGURE 2: SIMPLE LEARNING SCHEME**

An explanation of the different security levels can be found in the "Secure Data Products Handbook" (Comparison Chart, Section 1 [DS40168]).

The application note AN659 (*KEELOQ Simple Code Hopping Decode* [DS00663]), implements a decoder that can be used with an encoder using the simple learning method.

### KEELOQ NORMAL LEARNING SCHEME

#### (Serial Number Derived System)

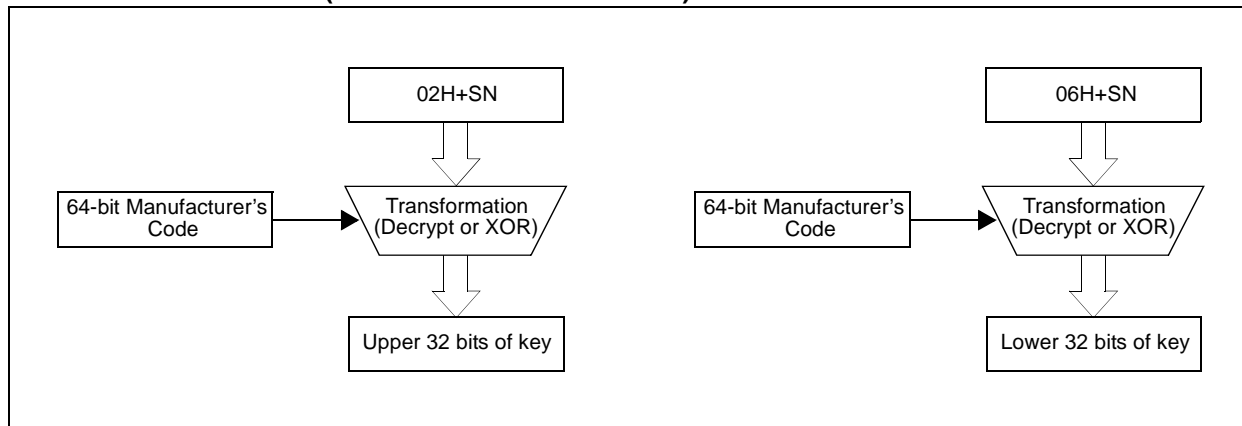

In this case, every transmitter is programmed with an incremental unique serial number. This serial number is used in conjunction with the 64-bit Manufacturer's Code and the KEELOQ algorithm to generate the Encryption Key. This Encryption Key is programmed into the encoder, thus, every transmitter has a different key that is used to encrypt the data.

A detailed explanation of this learning scheme can be found in the Technical Brief TB001 [DS91000A], part of the *Microchip Secure Data Products Handbook*.

The application note AN642 (*KEELOQ Code Hopping Decoder Using a PIC16C56*, [DS00642]), implements a decoder that can be used with the HCS programmed in this normal method.

The key generation scheme is shown below:

**FIGURE 3: NORMAL (SERIAL NUMBER-DERIVED) LEARNING SCHEME**

## OTHER POSSIBLE LEARNING SCHEMES

### (Secure Seed-Derived System)

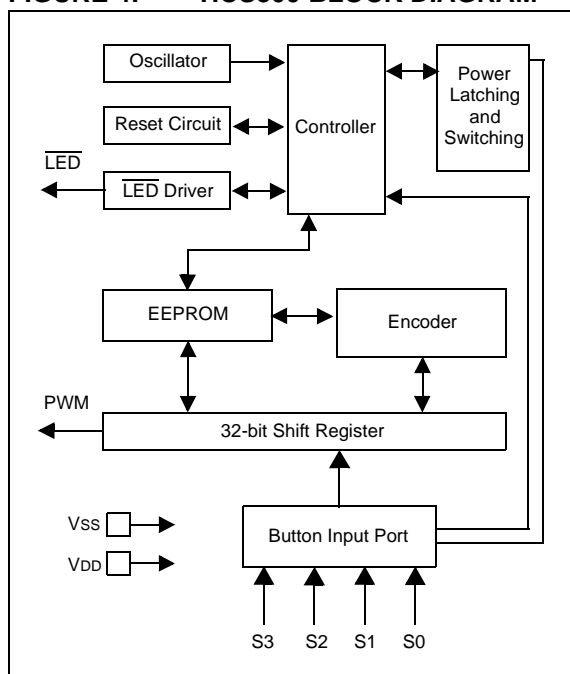

The two learning methods implemented in this application note are not the only schemes applicable. Refer to Technical Brief TB001 for more information on Secure Learning schemes.

Furthermore, custom learning scheme solutions can also be implemented.

## ENCODER EEPROM MEMORY ORGANIZATION

The KEELOQ encoders are EEPROM based devices with a built-in oscillator, wake-up on button press, reset circuit and internal logic state machine (Figure 4).

**FIGURE 4: HCS300 BLOCK DIAGRAM**

The HCS200, HCS300 and HCS301 contain 192 bits (12 \* 16-bit words) of EEPROM memory (Table 1). This EEPROM array is used to store the Encryption Key, the synchronization value, the serial number, etc.

A detailed description of the memory map is represented in Table 1.

TABLE 1: HCS30X EEPROM MEMORY MAP

WORD ADDRESS	MNEMONIC	DESCRIPTION
0	KEY_0	64-bit Encryption Key (word 0)
1	KEY_1	64-bit Encryption Key (word 1)
2	KEY_2	64-bit Encryption Key (word 2)
3	KEY_3	64-bit Encryption Key (word 3)
4	SYNC	16-bit Synchronization Value
5	RESERVED	Set to 0000H
6	SER_0	Device Serial Number (word 0)
7	SER_1	Device Serial Number (word 1)
8	SEED_0	Seed Value (word 0)
9	SEED_1	Seed Value (word 1)
10	EN_KEY	16-bit Envelope Key
11	CONFIG	Config Word

**Note:** The MSb of the serial number contains a bit used to select the auto shut-off timer.

In order to create the encrypted message transmitted to the receiver, the encoder uses the 64-bit Encryption Key and the 16-bit synchronous counter.

Certain configuration options can be selected for the different encoders. Table 2 shows the configuration word for the HCS300/1.

TABLE 2: HCS30X CONFIGURATION WORD

BIT NUMBER	BIT DESCRIPTION
0	Discrimination Bit 0
1	Discrimination Bit 1
2	Discrimination Bit 2
3	Discrimination Bit 3
4	Discrimination Bit 4
5	Discrimination Bit 5
6	Discrimination Bit 6
7	Discrimination Bit 7
8	Discrimination Bit 8
9	Discrimination Bit 9
10	Overflow bit 0 (OVR0)
11	Overflow bit 1 (OVR1)
12	Low Voltage Trip Point Select
13	Baud Rate Select Bit 0 (BSL0)
14	Baud Rate Select Bit 1 (BSL1)
15	Envelope Encryption Select (EENC)

**Note:** Please refer to the HCS200 data sheet [DS40138] for configuration details.

## PROGRAMMING/VERIFY WAVEFORM

The programming cycle allows programming of the 192-bits representing the serial number, the Encryption Key, the configuration word, etc., in a serial data stream into the encoder EEPROM.

Programming is initiated by forcing the PWM line high, after the S2 line has been held high for the appropriate length of time (TPS).

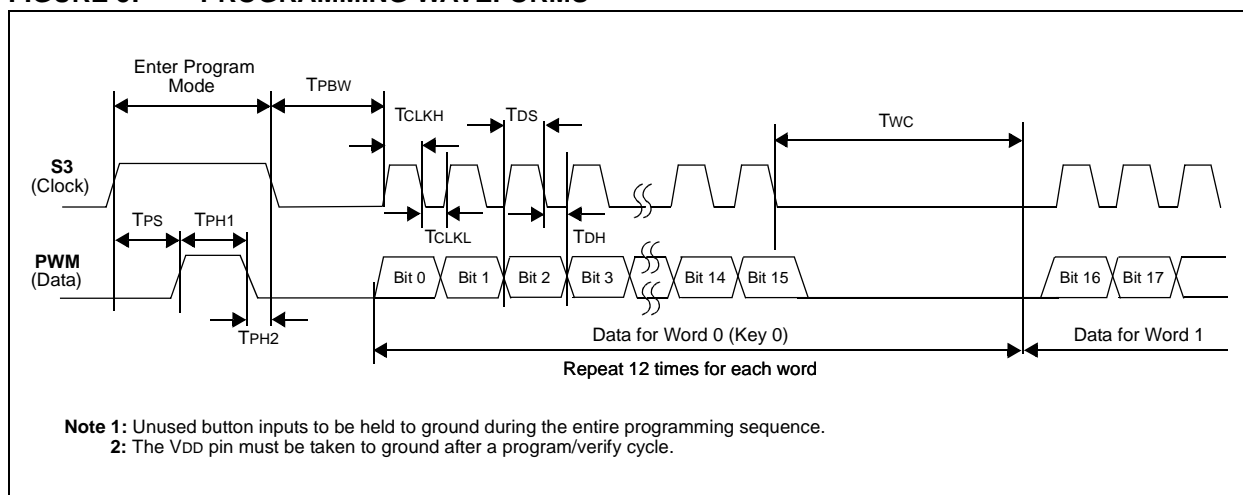

After the program mode is entered, a delay must be allowed during which the device erases the entire memory. This writes all locations in the EEPROM to zeros. The device can then be programmed by clocking in 16 bits at a time, using S2 as the clock line and PWM

as the data in line. After each 16-bit word is loaded, a programming delay is required for the internal program cycle to complete. This delay can take up to TWC (see Table 3).

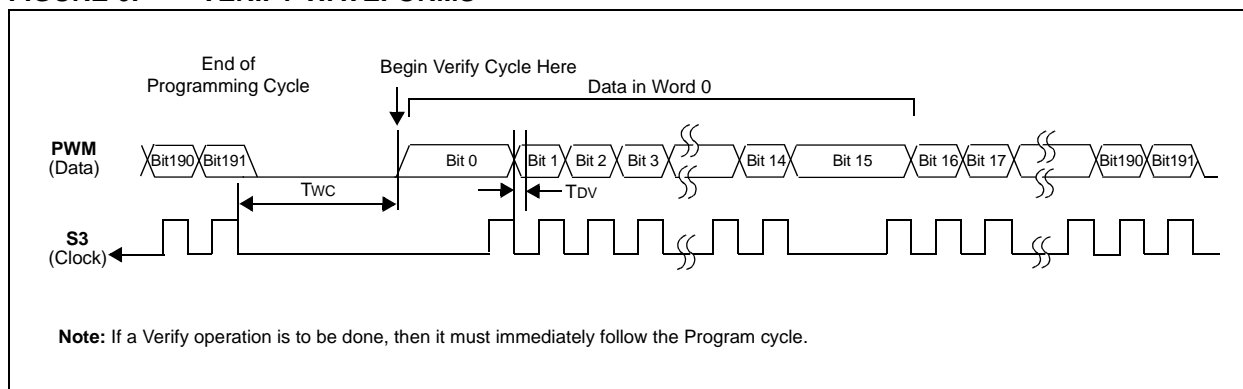

At the end of the programming cycle, the device can be verified (Figure 6) by reading back the EEPROM. Clocking the S2 line reads back the data on the PWM line. For security reasons, it is not possible to execute a verify function without first programming the EEPROM.

A verify operation can only be done once, immediately following the program cycle. This is important to prevent reading the internal memory of the encoder once it has been programmed.

**FIGURE 5: PROGRAMMING WAVEFORMS**

**FIGURE 6: VERIFY WAVEFORMS**

**Note:** For the HCS300 and HCS301, both the S2 pin and the S3 pin can be used as programming clock lines, and for the HCS200, only the S2 pin can be the clock line.

**TABLE 3: PROGRAMMING/VERIFY TIMING REQUIREMENTS**

VDD = 5.0V ± 10% 25°C ± 5°C				
Parameter	Symbol	Min.	Max.	Units
Program Mode Setup Time	TPS	3.5	4.5	ms
Hold Time 1	TPH1	3.5	—	ms
Hold Time 2	TPH2	50	—	μs
Bulk Write Time	TPBW	—	2.2	ms
Program Delay Time	TPROG	—	2.2	ms
Program Cycle Time	TWC	—	36	ms
Clock Low Time	TCLKL	25	—	μs
Clock High Time	TCLKH	25	—	μs
Data Setup Time	TDS	0	—	μs
Data Hold Time	TDH	18	—	μs
Data Out Valid Time	TDV	10	24	μs

## SOFTWARE IMPLEMENTATION

The software that implements the encoder programmer runs on the PIC16F84A.

The 64-bit Manufacturer's Code is stored in the internal PIC16F84A FLASH memory. This cannot be read if the device is code protected.

All the other parameters in the configuration word of the encoder are in the FLASH program memory of the PIC16F84A, where they are defined as constants.

The serial number programmed every time into the encoder is located instead, in the internal EEPROM data memory of the PIC16F84A.

In order to change the Manufacturer Code (MKEY\_X), or some parameter of the configuration word, as the voltage selection (VLOW), the baud rates transmission (BSL0, BSL1), etc., a change in the firmware is required. The following define can be modified in the assembly code:

```

=====
```

**Note:** The PIC16F84A program to build the HCS EEPROM memory map uses all these parameters.

The software given with this application note implements the Simple Key generation method, while the software that implements the Normal Key method is contained in the KEELOQ License agreement disks.

The software is composed of four main functions:

- Main loop routines
- Encryption Key generation routines
- Programming HCS routines
- Verify HCS routines

### Main Loop Routine (**M\_KEY\_GEN:** **SIMPLE\_KEY\_GEN, NORMAL\_KEY\_GEN,** **MAP\_SET**)

The program simply waits for a button press to proceed to the programming routines.

### Encryption Routines (**M\_KEY\_GEN:** **SIMPLE\_KEY\_GEN, NORMAL\_KEY\_GEN,** **MAP\_SET**)

The **M\_KEY\_GEN** routine can be different, by just changing the parameter called **KEY\_METHOD** from 0 to 1 in the modifiable table.

With the Simple Key generation method, the **SIMPLE\_KEY\_GEN** routine sets the Encryption Key equal to the Manufacturer Code. The **NORMAL\_KEY\_GEN** routine uses the KEELOQ decryption algorithm in order to create the Encryption Key, starting from the Manufacturer Code and the current serial number read from the PIC16F84A internal data memory.

The **MAP\_SET** routine prepares the 12 words (**WORD0** - **WORD11**) to be programmed in the HCS EEPROM map.

### Programming HCS Routines (**M\_PROGRAMMING**)

This routine starts driving the PWM line high, after the S2 line has been held high for the appropriate length of time, in order to bulk erase the encoder after 2.2 ms (TPBW).

Then, the **M\_NEW\_WORD** routine outputs the first word to be programmed on the PWM line synchronously with the clock S2 line and waits for the 36 ms of programming time (T<sub>wc</sub>).

This routine is repeated 12 times completing the entire programming of the HCS EEPROM memory map.

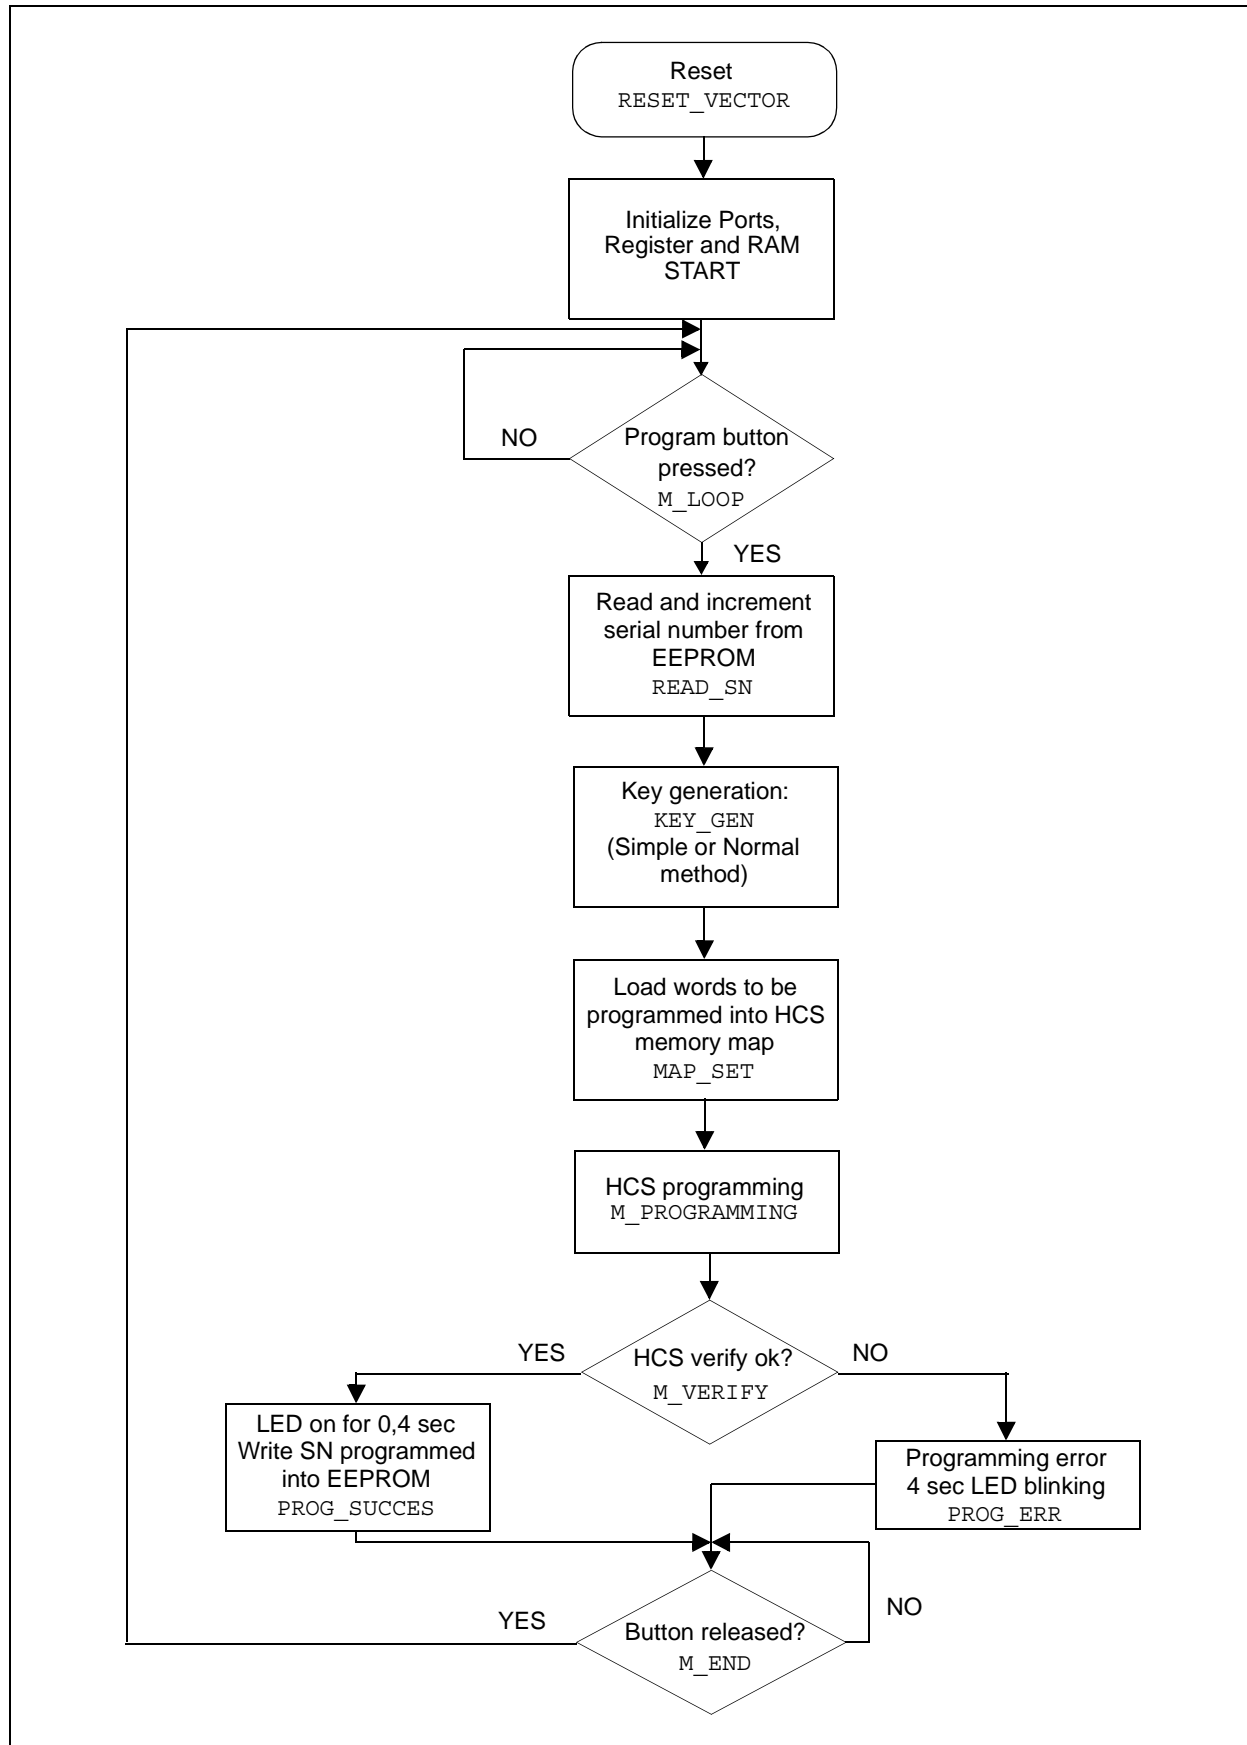

The **WAIT\_us** and **WAIT\_WMSEC** implements software delay routines to wait micro or milliseconds.

### Verify HCS Routines (**M\_VERIFY**)

At the end of the 12th word programmed, the **M\_VERIFY** routine continues to drive the clock line S2, reading back the EEPROM memory and verifying what was programmed before.

*Microchip received QS-9000 quality system certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona in July 1999. The Company's quality system processes and procedures are QS-9000 compliant for its PICmicro® 8-bit MCUs, KEELOQ® code hopping devices, Serial EEPROMs and microperipheral products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001 certified.*

## WORLDWIDE SALES AND SERVICE

### AMERICAS

#### Corporate Office
